

More than two decades ago researchers at the University of Hawaii working to develop natural medical remedies discovered a compound that not only held exciting implications for the health field, but also proved to be an efficient, 100 percent organic treatment solution for both home septic systems and commercial and municipal wastewater treatment facilities.

And the very best part of the story? It's the most environmentally responsible way to eliminate odors, solids, grease and the need for other costly treatment techniques.

Byo-Gon is safe enough for use in any household, and powerful enough for use in an urban wastewater treatment plant or factory. The product has a broad range of uses for both the home consumer, as well as municipal and industrial clients.

In the home, nothing is more effective, safe and environmentally friendly for treating septic systems than Byo-Gon . The product also can be used to clean greasy drains. Sprayed on top of home composting heaps, Byo-Gon stimulates the composting process, making home composting easier, quicker and even more eco-friendly.

Industrial and municipal clients rely on Byo-Gon 's unique ability to save work hours, money and the environment all at the same time.

To learn more about Byo-Gon, read specific case studies and schedule a demonstration, visit the Byo-Gon website at www.byogon.com, email info@byogon.com, or call **888-BYOGON-1**.

"In less than one month we went from being totally out of limits on our Discharge Monitoring Report to being well within our limits. The Mayor hasn't received any complaints and neither have we."
